

Python Extra Assignments

1. Write a function that converts “decimal no.” to “binary number”.
2. Write a function that takes a string and capitalizes the vowels in string.
3. Write a function that takes a string and trims all vowels from it.
4. Write a function that replaces a word with another word in a sentence. Do not use inbuilt replace function.

e.g. I love windows.
 I love linux.

5. Write a function to calculate area of a triangle.
6. Write a function to determine leap year.
7. Write a function that can reverse a string.
8. Write a function which returns the number of occurrences of each character in a string.
9. Write a function which takes a string input and finds the sum of ASCII value of individual characters of string.

e.g. INPUT: Python

Output: 642

Explanation: P has ASCII value 80, similarly y, t, h, o, n have ASCII values 121, 116, 104, 111 and 110. Hence, their sum is 642.

10. Write a program to take input two 2D matrices and find their sum. For simplicity consider input matrix a square matrix. First take input the size of matrix and then the elements of the matrix.
