

☒ EASY LEVEL (10 MCQs)

Q1. What is the purpose of an exploit?

- A. Encrypt data
- B. Backup files
- C. Take advantage of a vulnerability
- D. Clean memory

Answer: C

Q2. What does fuzzing help discover?

- A. Network interfaces
- B. System users
- C. Input vulnerabilities
- D. Backup paths

Answer: C

Q3. What tool is used for exploit writing in Python?

- A. Excel
- B. Metasploit
- C. Burp Suite
- D. Nmap

Answer: B

Q4. A plugin in Python is used to:

- A. Crash apps
- B. Hide source code
- C. Extend functionality
- D. Change Python syntax

Answer: C

Q5. Which keyword is used to import a Python module?

- A. include
- B. import
- C. module
- D. exec

Answer: B

Q6. What does ROP stand for in exploit dev?

- A. Remote Overflow Protocol
- B. Return Oriented Programming
- C. Reorder Operation Packets
- D. None

Answer: B

Q7. What is a buffer overflow?

- A. Memory leak
- B. Input longer than buffer
- C. Cache flush
- D. Router failure

Answer: B

Q8. Which is NOT a plugin target?

- A. VSCode
- B. Notepad
- C. Burp Suite
- D. Ghidra

Answer: B

Q9. Which function loads modules dynamically?

- A. open()
- B. load_module()
- C. importlib.import_module()
- D. execfile()

Answer: C

Q10. Which Python concept supports plugins?

- A. Loops
- B. Functions
- C. OOP and Modules
- D. Print statements

Answer: C

☒ MEDIUM LEVEL (20 MCQs)

Q11. What is shellcode?

- A. A Python script
- B. Code to launch shell via exploit
- C. Binary file format
- D. Firewall bypass technique

Answer: B

Q12. Which tool is used for fuzzing?

- A. Wireshark
- B. GDB
- C. Boofuzz
- D. Netstat

Answer: C

Q13. Which function is NOT safe against buffer overflows in C?

- A. strcpy()
- B. strncpy()
- C. fgets()
- D. snprintf()

Answer: A

Q14. Which exception is raised for import failure?

- A. ImportError
- B. ModuleNotFound
- C. PluginError
- D. ValueError

Answer: A

Q15. What is the output of `importlib.import_module('math')`?

- A. Error
- B. Imports math functions
- C. Opens calculator
- D. Writes file

Answer: B

Q16. What type of programming is plugin architecture based on?

- A. Procedural
- B. Declarative
- C. Event-driven
- D. Object-Oriented

Answer: D

Q17. Which file extension is common for plugins?

- A. .exe
- B. .zip
- C. .py
- D. .dll

Answer: C

Q18. In plugin dev, the main app usually:

- A. Contains all logic
- B. Dynamically loads and runs plugins
- C. Has no interaction
- D. Hardcodes each plugin

Answer: B

Q19. What does ASLR protect against?

- A. SQL Injection
- B. Memory corruption
- C. XSS
- D. Directory traversal

Answer: B

Q20. How do Python plugins typically share a common structure?

- A. Environment variables
- B. Interfaces/inheritance
- C. Shell scripts
- D. YAML files

Answer: B

Q21. What does run() represent in plugin classes?

- A. Constructor
- B. Destructor
- C. Entry point
- D. None

Answer: C

Q22. Which vulnerability allows remote code execution?

- A. SQL Injection
- B. XSS
- C. RCE
- D. CSRF

Answer: C

Q23. Which of the following is a debugger used in exploit dev?

- A. OllyDbg
- B. Curl
- C. Netstat
- D. Ping

Answer: A

Q24. Python plugin frameworks often use:

- A. JSON only
- B. Socket communication
- C. Reflection and dynamic loading
- D. Binary search

Answer: C

Q25. A plugin's main requirement is:

- A. High memory
- B. Shared class/method
- C. GUI support
- D. Static typing

Answer: B

Q26. What technique chains small code pieces?

- A. NOP sled
- B. Jump table
- C. ROP
- D. DLL injection

Answer: C

Q27. What method lets you inherit plugin features?

- A. Overriding
- B. Extending Interface
- C. Both A and B
- D. None

Answer: C

Q28. What does NotImplementedException indicate?

- A. Bug
- B. Missing import
- C. Unimplemented interface method
- D. Wrong syntax

Answer: C

Q29. What's the use of msfvenom?

- A. Ping scanner
- B. Payload generator
- C. Web browser
- D. Compiler

Answer: B

Q30. Which command attaches GDB to a running PID?

- A. gdb <filename>
- B. gdb -p <pid>
- C. attach-pid
- D. trace -gdb

Answer: B

☒ **HARD LEVEL (10 MCQs)**

Q31. Which command in GDB shows backtrace?

- A. bt
- B. trace
- C. list
- D. stack

Answer: A

Q32. Which of the following is used to bypass ASLR?

- A. Static shellcode
- B. Format string attack
- C. ROP gadgets
- D. NOP sled only

Answer: C

Q33. What can lead to format string vulnerability?

- A. print(user)
- B. printf(user)
- C. echo user
- D. scanf("%s")

Answer: B

Q34. Which library can dynamically create code in memory?

- A. ctypes
- B. json
- C. base64
- D. hashlib

Answer: A

Q35. What is sys.modules used for?

- A. Unload memory
- B. Log errors
- C. Track imported modules
- D. Start HTTP server

Answer: C

Q36. In a plugin system, how do you discover modules?

- A. os.listdir()
- B. pkgutil.iter_modules()
- C. scan_plugin()
- D. plugin.read()

Answer: B

Q37. Why is interface enforcement important in plugins?

- A. Faster execution
- B. More memory
- C. Predictable behavior
- D. GUI integration

Answer: C

Q38. Which architecture do most plugin systems use?

- A. MVC
- B. Microkernel
- C. Monolithic
- D. Hybrid

Answer: B

Q39. What does `exec()` do in context of plugin loading?

- A. Run OS command
- B. Execute dynamic Python code
- C. Open browser
- D. Start server

Answer: B

Q40. A secure plugin loader must avoid:

- A. Code comments
- B. Dynamic imports
- C. Untrusted input
- D. Python 3

Answer: C
